CS 242

Project Part 1

At the moment if a negative number is provided as a value for the port number, the number will simply be represented as such. To fix this issue, we could set the port number to be the absolute value of the number imputed by the user, or we could set it so that the default port number is used when an invalid number is inputted by the user. If a user name is entered as null, the program states so. In order to fix this issue in future updates, we could provide an error message and have the user re-input a valid username. Otherwise, the program seems to function correctly and up to specifications. The final branch is Pt1FinalCode. We uploaded it without the additional files and it kept adding them anyways.
